Clinician's Guide to Chronic Headache and Facial Pain Gary W. Jay 2016-04-19 As

headache and facial pain are two of the most common medical complaints, it is essential that clinicians are well equipped to handle these issues. Clinician's Guide to Chronic Headache and Facial Pain is designed for all clinicians dealing with these syndromes in daily practice-whether in the outpatient, emergency, or ambulatory setting. Features

Evidence-Based Interventional Pain Medicine Jan Van Zundert 2011-10-19

Unrelieved chronic pain is a worldwide epidemic Chronic pain has been subject to multiple international initiatives through the World Health Organization.

Interventional Pain Medicine, the use of minimally invasive techniques to relieve

pain, is the best approach when simpler measures such as physical therapy or medications fail. However, these procedures can be associated with significant risk and expense. Establishing uniformity in diagnostic criteria and procedural performance can reduce both morbidity and unnecessary procedures, and hence healthcare expenditures. While other texts explain how to perform these procedures, little focus has been given to diagnostic considerations: if and when these procedures should be performed.

Evidence-Based Interventional Pain Medicine focuses on a balance between effectiveness and safety of interventional management for specific diagnoses, across all areas of chronic pain including: Head, neck and shoulder pain Lower back pain Neuropathic pain syndromes Complex Regional Pain Syndrome Pain in patients with cancer Vascular and visceral pain

Evidence-Based Interventional Pain Medicine provides essential knowledge for anyone who uses, or intends to use, interventional pain techniques.

Neurologic Differential Diagnosis Alan B. Ettinger 2014-04-17 "There is an apocryphal story of an eminent neurology professor who was asked to provide a differential diagnosis. He allegedly quipped: "I can't give you a differential diagnosis. If you wish I will give you a list of wrong diagnoses followed by the right diagnosis." Sadly, this sort of arrogance pervaded our field, particularly in the era before there were accurate diagnostic methods and effective treatments of neurological diseases. Fortunately, this sort of pomposity is now relegated to the past and remains only as an antique reminder of a type of hubris that precluded discovery and progress in diseases of the nervous system"--

Pathophysiology of Headaches Messoud Ashina 2015-04-14 This book provides a detailed overview of the current state of knowledge regarding the pathophysiology of both primary headaches - migraine, tension-type headache (TTH), and cluster headache - and the very important and frequent type of secondary headache, medication overuse headache (MOH). After an introductory chapter describing relevant neuroanatomy and vascular anatomy, the evidence gained from animal models regarding the pathophysiology of migraine and the other primary headaches is reviewed. Knowledge of the genetic

component in the different types of headache is then examined with reference to recent evidence, for example regarding the implication of the trigeminovascular system and cortical spreading depression in migraine. Detailed information is provided on insights into primary headaches from imaging studies, including functional magnetic resonance imaging and positron emission tomography and on their neurophysiology and biochemistry. A further series of important chapters describe present knowledge of the pathophysiology of each specific type of headache and consider future directions. Written by acknowledged experts in their fields from Europe and the United States, clinicians and students will find *Pathophysiology of Headaches* to be an excellent source of up-to-date information on why patients experience headaches. In addition, it will be of value for pain

researchers investigating the underlying mechanisms of headache.

Orofacial Pain Joanna M. Zakrzewska
2009-08-27 Orofacial pain - defined as pain lasting over three months in the mouth or face - is increasing in prevalence, with approximately 7% of the UK population having experienced it. It is currently managed by either dentists or general medical practitioners, both of whom have radically different approaches to treatment. While management of orofacial pain has improved quite dramatically over recent years, it is essential that dentists and general practitioners are aware of these advances and of the differences in their approaches. This concise handbook takes an evidence-based psychosocial approach to the management of patients with pain in the face or mouth and provides basic guidelines to facilitate care quickly in the clinical setting. The book will serve as a

useful guide for dental practitioners, specialists in orofacial pain, trainee pain specialists, neurologists with an interest in pain, specialist pain nurses, as well as general medical practitioners.

While the structure of the previous version has been maintained, this book offers

evidence-based concepts where available and reflects many significant changes in the field of orofacial pain. For example, an entire chapter is now devoted to cervical disorders to emphasize the close relationships between some orofacial pain disorders and cervical pain disorders and to cast greater attention on their differences and similarities. Because they constitute a major part of orofacial pain and affect so many, temporomandibular disorders are the primary topic of several chapters as well as a major focus of the chapter of classification. Other important topics covered in detail include neuropathic pain conditions, odontogenic pain, and mucogingival disorders. This long-awaited edition arms clinicians with new insights and procedures for assessing, diagnosing, and managing patients who present with symptoms of orofacial pain.

Drug-Induced Headache Hans-Christoph Diener 2012-12-06 M. WILKINSON Patients with frequent or daily headaches pose a very difficult problem for the physician who has to treat them, particularly as many patients think that there should be a medicine or medicines which give them instant relief. In the search for the compound which would meet this very natural desire, many drugs have been manufactured and the temptation for the

physician is either to increase the dose of a drug which seems to be, at any rate, partially effective, or to add one or more drugs to those which the patient is already taking. Although there have been some references to the dangers of overdosage of drugs for migraine in the past, it was not until relatively recently that it was recognized that drugs given for the relief of headache, if taken injudiciously, may themselves cause headache. The first drugs to be implicated in this way were ergotamine and phenazone. In the case of ergotamine tartrate, the dangers of ergotism were well known as this was a disorder which had been known and written about for many years. In the treatment of headache, fully blown ergotism is rare and in recent years has usually been due to self-medication in doses much greater than those prescribed although there are a few recorded cases where toxic amounts have

been given.
